

SOLUTION ARCHITECTURE REPORT

Date	15 March 2026
Team ID	ghousiyaunnissa@gmail.com
Project Name	Credit Card Approval Prediction
Maximum Marks	5 Marks

SOLUTION ARCHITECTURE DIAGRAM

The visual representation below outlines the layered micro-framework architecture map designed for the predictive system, showing communication loops between presentation, handling components, and structural weight stores.

- Generated Application Baseline Simulation Records (cc_approval_data.csv)

COMPONENT DESCRIPTION TABLE

COMPONENT NAME	DESCRIPTION / ROLE IN ARCHITECTURE	TECHNOLOGIES USED
[Presentation Layer]	Serves an interactive financial data validation portal interface. It renders form input cards mapping clean attributes (Income, Housing, Credit parameters) and presents instantaneous approval results using CSS-driven alert boxes.	HTML5 CSS3 Grid Jinja2 Templates
[API Gateway]	Acts as the network perimeter router. It maps incoming HTTP entry routes, processes client form post requests, performs request data captures safely, and translates internal application responses back into web outputs.	Flask Microframework WSGI Server Engine
[Microservices / Core Logic]	Orchestrates runtime feature ingestion. It models live arrays to fit training dimensions, loads matrix properties, converts categorical text drop-downs safely into dummy flags, and computes algorithmic class metrics.	Python 3 Pandas Matrix Tool Scikit-Learn Machine Learning
[Database / Storage]	Maintains model parameters on the file system. It stores the array coefficients, structural data features, and historical dataset references so that calculations can occur instantly without running full model cycles.	Local File System Pickle Serialization CSV Engine Structure
